Re: Plan Review Comments: 9764 Valley View Road lot consolidation plat

---

The plat for the above named item, dated 03-28-25, has been reviewed. The following comments are offered:

- The plat does not increase the number of parcels, and does not create any new non-conforming or land-locked parcels. Previously, the Migcan parcel was split between zoning districts. This plat will result in all of Parcel 1 falling within the B-1 district, and all of Parcel 2 falling within the B-O district.
- Planning Commission approval is recommended for this plat.

Memorandum

TO: Nicholas Molnar, Mayor
and Macedonia Planning Commission

FROM: Brian M. Frantz, AICP

SUBJECT: Lot Consolidation – Parcels 33-13268 (9804-9828 Valley View Road) and 33-01195 (9764 Valley View Road)

DATE: April 6, 2025

I have reviewed an application (and lot consolidation plan) dated March 21, 2025 in connection with this request and offer the Planning Commission with the following comments for their consideration:

Request

The applicant is proposing to combine a portion of Parcel 33-13268 (~35,000 sq.ft.) with existing Parcel 33-01195 (9764 Valley View Road). The consolidation results in Parcel 33-01195 (9764 Valley View Road) enlarging to 2.1167 acres and Parcel 33-13268 (9804-9828 Valley View Road) reducing in size to 3.3148 acres.

Analysis

Lot splits and consolidations are subject to the requirements of the Subdivision Regulations. Specifically, Section 1117.03 (b) details the standards for lots. This proposal complies with the lot requirements of the Zoning Code, as well as the standards set forth in Section 1117.03 (b). Specifically, the width to depth (less than 2:1) is a desirable ratio identified in the regulations.

For the purposes of documentation, Parcel 33-01195 (9764 Valley View Road) is zoned R-1 Residence District and Parcel 33-13268 (9804-9828 Valley View Road) is zoned B-1 Convenience Business District. The approximate 35,000 square feet being removed from Parcel 33-13268 is zoned R-1 Residence District and will align with the zoning of Parcel 33-01195 (9764 Valley View Road) with this consolidation.

Conclusion

At this time, I recommend this proposal be approved. Please do not hesitate to contact me with any questions.

Re: Specialty Lubricants Corp. Proposed Expansion
8300 Corporate Park Drive, Macedonia, Ohio

Following the preliminary planning approval of the proposed expansion project for the existing Specialty Lubricants manufacturing and office facility, we are pleased to submit this letter for final planning approval. We have incorporated the recommended modifications of this board to further align the project with the city's planning goals.

The revised plans reflect the following updates based on your feedback:

- **Window Elimination and Wall Louvers**: The originally proposed windows have been removed, and wall louvers similar to those on the existing building have been added to maintain a consistent exterior appearance.
- **Outdoor Storage Improvements**: The outdoor storage area will now be enclosed within a board-on-board fence, enhancing both security and visual screening.
- **Landscaping Adjustments**: Modifications have been made to the landscaping plan replacing the Colorado Blue Spruce with Vanderwolf Pines, and Barberry with Nine Barks as requested, providing improved site aesthetics and alignment with city recommendations.

Additionally, we are pleased to note that the 113-car parking variance was granted by the Board of Zoning Appeals at the March 19, 2025, meeting.

These adjustments maintain the overall project intent while ensuring the design remains complementary with the existing structure. The addition will continue to feature precast concrete wall panels with a consistent color scheme to the existing facility. Furthermore, the recessed docks, drive-in overhead door, and stormwater management basin remain integral to the design, ensuring efficient operations and environmental responsibility.

We are committed to delivering a project that benefits the community and supports the continued growth of Specialty Lubricants operations. Thank you for your consideration. Please feel free to contact me if you have any questions or require further information.

Jeff M. Certo

Re: Specialty Lubricants, 8300 Corporate Park Drive
Preliminary Stormwater Management

Dear Mr. Gruszewski,

The Riverstone Company has reviewed the proposed site plan for the facility expansion at the Specialty Lubricants site at 8300 Corporate Park Drive in the City of Macedonia. The proposed improvements include a 49,000+ sf building addition and pavement expansion to provide truck access to the new loading docks and drive in door. The improvements will increase the amount of impervious area on site and will disturb more than 1 acre of land therefore detention and treatment of the water quality volume will be required.

The water quality volume required to be treated is determined by the Ohio EPA Construction General Permit and is based on the disturbed area of the project. Based on the site plan, Riverstone is anticipating a disturbance of about 3 acres with about 1.90 acres of impervious area after construction. This would require the treatment of about 6,000 cubic feet of stormwater.

The detention requirements are based on the critical storm which compares the runoff from the predevelopment site conditions and the post development site conditions. Based on the current site plan, Riverstone anticipates this being a 10 year critical storm. This would mean that storms at or below the critical storm (1, 2, 5 and 10 year events) would be held to the current runoff from the 1 year storm. Storms larger than the critical storm (25, 50 and 100 year events) would require the storm runoff to be reduced to the existing runoff for the corresponding storm event. The preliminary calculations show an approximate detention volume of about 19,000 cubic feet for the 100 year event.

RIVERSTONE
LAND SURVEYING • ENGINEERING • DESIGN

Detention and water quality treatment will be handled in the new retention basin proposed near Corporate Park Drive. Storm sewers will be used to collect runoff from the building and paved area and convey the stormwater to the new retention basin. The basin will detain the water quality volume and release it over a 48 hour period. Storm water above the required water quality volume will be detained and released to meet the requirements of the critical storm.

The proposed basin is currently planned to be a wet retention basin that will always hold water. During storm events the water level will rise but will recede over the following 48 hours after the storm and return to the water level before the storm event.

Should you have any questions pertaining to this letter, please contact The Riverstone Company.

Very truly yours,
THE RIVERSTONE COMPANY

MEMORANDUM

To: Mr. Nicholas Molnar, Mayor
Mr. Nino Monaco, Building Commissioner

From: Pam Schultz, Architectural Review Consultant

Subject: Specialty Lubricants
8300 Corporate Park Drive
Macedonia, OH

Date: April 11, 2025

I have reviewed the revised plans submitted for Specialty Lubricants dated 03.28.25. The proposed plans are for a 49,680 sf addition to an existing 69,223 sf building. The building is located in an industrial area which is covered by the Architectural Design Standards of Macedonia, OH along with specifically, 1172.02 of the Applicable City-Wide Standards. With those standards in mind, I offer the following for your consideration:

1. The drawings call for the addition to be made from precast concrete wall panels. Details are not provided of the horizontal reveals shown on the drawings. A reveal will add to the three-dimensional quality and overall look of the addition. Materials for the addition need to be maintenance free or the owner should provide an agreed upon maintenance plan for future painting needs. (Re-painting a 50,000 sf addition every 10 years is somewhat problematic and should be discussed and approved by the Commission).
2. Any HVAC units were not shown on drawings as requested in the January memo. The materials, colors and finishes used for screening rooftop units and any surface equipment shall be consistent with the primary structure and should be an integral part of the building design. (please see 1172.02(a)(4) of Applicable City-Wide Standards.
3. The drawings call for covered outdoor storage utilizing a board-on-board fence. Drawings and details are needed for this structure. Colors should be provided. The area must utilize materials consistent with the building and be built with a harmonious intent in mind. (please see 1172.02(a)(2)(3)(5) Detailed drawings are needed or approved by the Commission.
4. If a dumpster is utilized, the dumpster enclosure shall be placed on the site plan and materials should be called out for review. Any doors or gates, must be self-closing and all should be made of maintenance-free materials to match the building.

It is my recommendation the applicant address the issues listed above. Details are needed of any exterior HVAC locations, the "covered outdoor storage" and the dumpster area design.

Please feel free to contact me with any questions or comments.
Thank you!

Memorandum

TO: Nicholas Molnar, Mayor
and Macedonia Planning Commission

FROM: Brian M. Frantz, AICP

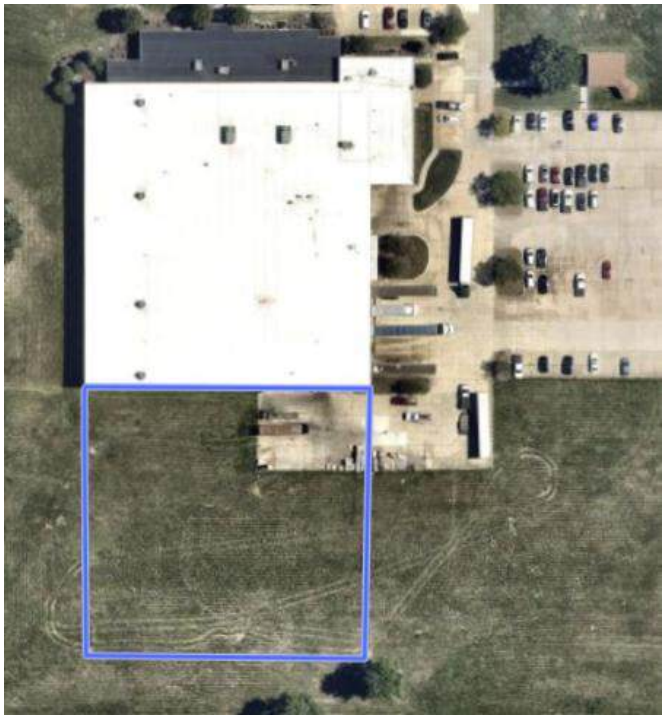
SUBJECT: Final Plan Approval - Specialty Lubricants Building Addition & Site Improvements

DATE: April 5, 2025

The applicant (Specialty Lubricants) is proposing to construct a 49,680 square feet addition to the existing 67,582 square feet building on the property located at 8300 Corporate Park Drive. When complete, the building will be 117,262 square feet on approximately 11 acres. The site is zoned General Industrial (GI) and the industrial use is permitted by right in this District.

I have reviewed an application for final plan approval dated March 28, 2025 (including a site plan and architectural elevations) in connection with this request and offer the Planning Commission with the following comments for their consideration:

Background
The proposal is to construct an additional 49,680 square feet (216'x230') of manufacturing/distribution space to the west end of the existing building in an area that is substantially grass (see image to the right – blue square represents the addition).



The final plan submission now depicts the 17'x62' (1,054 sq.ft.) outdoor storage space screened using a board-on-board fence instead of the previously proposed chain link fence with privacy slats. Please note: the screen fence is proposed to be 12 feet tall.

Revisions to the overall building architecture are proposed based on discussions with the Planning Commission during preliminary plan approval.

Analysis

(1) **Parking** – The project summary on Sheet SP.1 states that 236 off-street parking spaces are required, and 123 spaces are provided. My calculation of the required off-street parking is based on the office and warehouse use, but takes out 20% of the floor area for mechanical uses. Using this approach compared to the building use break-down in the project summary, 32 parking spaces are required for the office, 96 spaces for the manufacturing, and 61 are required for the warehouse space, for a total of 189 required off-street parking spaces post construction. With 123 spaces being provided, the site is deficient 66 parking spaces. The site plan states that the

actual employee count is 85 to justify the reduction. **ACTION ITEM: None, a variance of 113 parking spaces was granted at the March 19th meeting by the Board of Zoning Appeals (BZA).**

(2) **Landscaping** – Landscaping is provided on Sheet L.1 and documents a long three-foot-tall mound that extends the entire rear of the proposed addition and approximately half of the existing building. Generally, the plan proposes a good mixture of deciduous and coniferous trees. **ACTION ITEM: As previously stated, additional landscape materials/mounding should be added to the west side of the building addition. Currently, the proposal only includes a single Celebration Maple (see image to the right).**

(3) **Outdoor Storage** – The proposed outdoor storage is now proposed to be screened using a 12-foot-tall board-on-board privacy fence. **ACTION ITEM: None, however the screen fence is 12 feet tall and should be confirmed as acceptable by the Planning Commission.**

(4) **Lighting** –Sheet E-900 provides information regarding the site photometrics. **ACTION ITEM: None, the proposed lighting levels are acceptable and provide no light bleed at the property lines.**

(5) **Stormwater Drainage** – A new storm water basin is conceptually illustrated adjacent to the entrance driveway. **ACTION ITEM: A letter from Riverstone dated January 17, 2025 describes the proposed basin. The City Engineer will confirm these details and determine if the basin is acceptable as proposed.**

(6) **Building Architecture** – Sheet SK.2 provides revised details regarding the existing and proposed architecture. The revised architecture based on conversations with the Planning

Commission now includes 4'x4' metal louvers to match the existing instead of utilizing windows. **ACTION ITEM: The proposal seems to propose the items previously discussed with the Planning Commission. If the Commission finds these changes acceptable, then I believe the proposal can be approved as submitted subject to final confirmation by the City's Design Reviewer.**

(7) **Miscellaneous** – A signature block for the Planning Commission Chair must be added to the front cover sheet on the final site plan.

Conclusion

The applicant addressed most of the items from the preliminary plan discussion. A few things remain and should be documented on a revised final plan submission. If acceptable, this final review can be conducted administratively to avoid an additional meeting with the Commission.

Please do not hesitate to contact me with any questions.

FAILURE TO PROVIDE A LIST OF CUSTOMER ADDRESSES IN A TIMELY MANNER MAY RESULT IN PROJECT DELAYS.

ANY CITY-OWNED LEAD SERVICE LINE ENCOUNTERED SHALL BE REPLACED WITH TYPE K COPPER. THE REPLACEMENT SERVICE LINE SHALL BE SIZE-ON-SIZE WITH A 1-INCH MINIMUM DIAMETER. IF A CUSTOMER-OWNED LEAD SERVICE LINE IS ENCOUNTERED, THE CONTRACTOR SHALL LEAVE A CWD-SUPPLIED CUSTOMER NOTIFICATION DOOR HANGER ON ALL ACCESSIBLE POINTS OF ENTRY TO THE HOME AND IMMEDIATELY NOTIFY THE CWD INSPECTOR. Performance Curve – HPG200

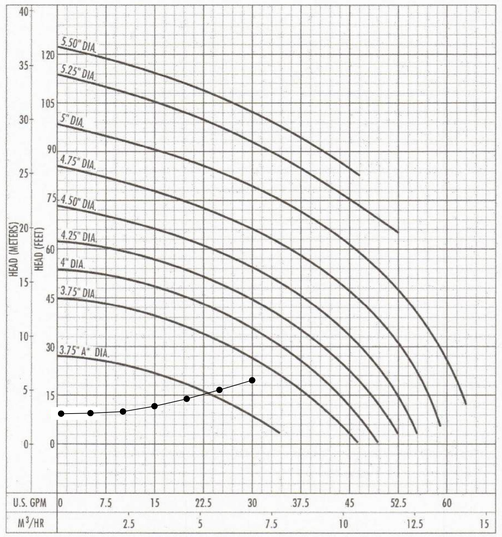
RPM: **3450** DISCHARGE: **1-1/4"**



The curves reflect maximum performance characteristics without exceeding full load (Nameplate) horsepower. All pumps have a service factor of 1.2. Operation is recommended in the bounded area with operational point within the curve limit. Performance curves are based on actual tests with clear water at 70° F. and 1280 feet site elevation.

Conditions of Service:
GPM: 9 TDH: 10.19 FT.

PENTAIR HYDROMATIC®

Specifications – HPG200

SUBMERSIBLE SEWAGE GRINDER PUMPS

GENERAL

Contractor shall furnish all labor, materials, equipment and incidentals required to provide 2 (qty.) submersible centrifugal sewage grinder pump(s) as specified herein.

OPERATING CONDITIONS

Each pump shall be rated 2 hp,
produce 9 U.S. GPM at 10.19 feet TDH.

CONSTRUCTION

Each pump shall be of the sealed submersible grinder type, manufactured by Pentair Hydromatic. The pump volute, motor and seal housing shall be high quality gray cast iron, ASTM A-48, Class 30. All external mating parts shall be machined and Nitrile O-ring sealed on a beveled edge. Gaskets shall not be acceptable. All fasteners exposed to the pumped liquid shall be 316 series stainless steel.

ELECTRICAL POWER/CONTROL CORD

Electric power/control cord shall be SOOW water resistant 600V, 90°C, UL and/or CSA approved. The single cord shall incorporate both power and sensor leads and shall be a minimum of seven (7) 12 gauge conductors.

The pump shall be protected with compression fitting and epoxy potted area at the power cord entry to the pump. A separation between the junction box areas of the pump and the motor by a stator lead sealing gland or terminal board shall not be acceptable.

The power cable entry into the cord cap assembly shall first be made with a compression fitting. Each individual lead shall be stripped down to bare wire, at staggered intervals, and each strand shall be individually separated. This area of the cord cap shall then be filled with an epoxy compound potting which will prevent water contamination to gain entry even in the event of wicking or capillary attraction.

The power cord leads shall then be connected to the motor leads with heavy duty connectors having copper inserts with a crimped wire-to-wire connection, rather than a terminal board that allows for possible leaks.

The cord cap assembly shall be sealed with a Nitrile O-ring on a beveled edge to assure proper sealing.

MOTOR

The stator, rotor and bearings shall be mounted in a sealed submersible type housing. The stator windings shall have Class F insulation (155°C or 311°F) and a dielectric oil-filled motor, NEMA B design (three-phase), NEMA L design (single-phase). Because air-filled motors do not dissipate heat as efficiently as oil-filled motors, they shall not be acceptable.

The pump and motor shall be specifically designed so that they may be operated partially dry or completely submerged in the liquid being pumped. The pump shall not require cooling water jackets. Dependence upon, or use of, water jackets for supplemental cooling shall not be acceptable.

Stators shall be securely held in place with a removable end ring and threaded fasteners. No special tools shall be required for pump and motor disassembly.

Pump shall be equipped with heat sensors. The heat sensor(s) (one on single-phase, two on three-phase) shall be a low resistance, bimetal disc that is temperature sensitive. It (they) shall be mounted directly in the stator and sized to open at 120°C or 130°C and automatically reset at 30–35°C differential. The sensor shall be connected in series with the motor starter coil so that the starter is tripped if a heat sensor opens. The motor starter shall be equipped with overload heaters so all normal overloads are protected by an external heater block.

BEARINGS AND SHAFT

An upper single row ball radial bearing and a lower single row ball thrust bearing shall be provided. Bearings shall be permanently lubricated by the dielectric oil that fills the motor housing.

PENTAIR HYDROMATIC®

The shaft shall be machined from solid 400 series stainless steel and be designed with large diameters and minimum overhang to reduce shaft deflection and prolong bearing and seal life.

SEALS AND SENSORS

The rotor and stator in the motor housing shall be separated and protected from the pumped liquid by an oil-filled seal housing incorporating two type 21 carbon ceramic mechanical seals mounted in tandem. The seal housing shall be equipped with a moisture sensing probe installed between the seals, and the sensing of moisture in the seal chamber shall be automatic, continuous and not require the pump be stopped or removed from the wet well.

IMPELLER

The impeller shall be designed for rough duty service and shall be of a five-vane, semi-open design with hydrodynamic sealing vanes on the rear shroud. The impeller shall be constructed of engineered thermoplastic, with a permanently molded, hexagonally locked bronze insert. The impeller shall be of a non-overloading design and be factory or field trimable to meet specific performance conditions.

Optional all stainless steel impeller available.

GRINDER CUTTERS

The combination centrifugal pump impeller and grinder unit shall be attached to the common motor and pump shaft made of 416 stainless steel. The grinder unit shall be on the suction side of the pump impeller and discharge directly into the impeller inlet, leaving no exposed shaft to permit packing of ground solids. The grinder shall consist of two stages. The cutting action of the second stage shall be perpendicular to the plane of the first cut for better control of the particle size. The grinder shall be capable of grinding normal domestic sewage. Both stationary and rotating cutters shall be made of 440C stainless steel hardened to Rockwell 60C and ground to close tolerance.

The upper (axial) cutter and stationary cutter ring shall be reversible to provide new cutting edges to double life. The stationary cutter ring shall be pressed into the suction opening of the volute and held in place by three (3) 300 series stainless steel screws. The lower (radial) cutter shall macerate the solids against the I.D. of the cutter ring and extrude them through the slots of the cutter ring. The upper (axial) cutter shall cut off the extrusions, as they emerge from the slots of the cutter ring to eliminate any roping effect that may occur in single stage cutting action. The upper (axial) cutter shall fit over the hub of the impeller and the lower (radial) cutter shall be slip-fit and secured by means of peg and hole and rotate simultaneously with the rotation of the shaft and impeller. The grinding mechanism shall be locked to the shaft by a 300 series stainless steel countersunk washer in conjunction with a 300 series stainless steel flat head cap screw threaded into the end of the shaft.

TESTING

Commercial testing shall be required and include the following:

The pump shall be visually inspected to confirm that it is built in accordance with the specifications as to hp, voltage, phase and hertz.

The motor and seal housing chambers shall be hi-potted to test for moisture content and/or insulation defects.

Pump shall be allowed to run dry to check for proper rotation.

Discharge piping shall be attached, the pump submerged in water, and amp readings taken in each leg to check for an unbalanced stator winding. If there is a significant difference in readings, the stator windings shall be checked with a bridge to determine if an unbalanced resistance exists. If so, the stator will be replaced.

PAINT

The pump shall be painted with waterborne hybrid acrylic/alkyd paint. This custom engineered, quick dry paint shall provide superior levels of corrosion and chemical protection.

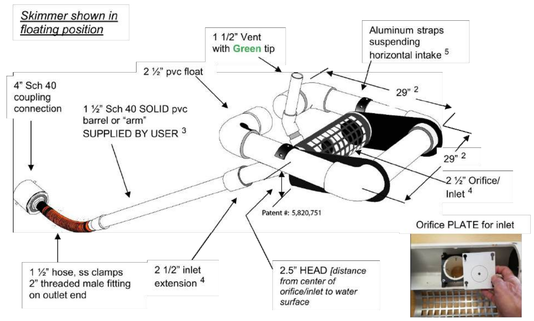
2½" Faircloth Skimmer® Cut Sheet

www.FairclothSkimmer.com



1. Skimmer can be attached to a straight 4" sch 40 pipe but the pipe may need to be anchored to the bottom at the connection so it is secure. Coupling can be removed and hose attached to outlet using the threaded 2" fitting.
2. Dimensions are approximate, not intended as plans for construction.
3. Barrel (solid, not foam core pipe) should be 1.4 times the depth of water with a minimum length of 6' so the inlet can be pulled to the side for maintenance. If more than 8' long weight may have to be added to inlet to counter the increased buoyancy.
4. Orifice/inlet tapers down from 2 ½" maximum inlet to a 1½" barrel and hose. Barrel is smaller to reduce buoyancy and tendency to lift inlet but is sufficient for flow through inlet because of slope. The orifice/inlet can be reduced using the plate and cutter provided to control the outflow rate – see #6.
5. Horizontal intake is 5" pipe between the straps with aluminum screen door for access to the 2½" inlet and orifice inside.
6. **Capacity**: 6,234 cubic feet per day maximum with 2½" inlet and 2.5 head. Inlet can be reduced by installing a smaller orifice using the plate and cutter provided to adjust flow rate for the particular drawdown time required. Please use the sizing template at www.faircloth skimmer.com .
7. Ships assembled. User glues inlet extension and barrel, installs vent, cuts orifice in plate and attaches to outlet pipe or structure. Includes float, flexible hose, rope, and orifice plate and cutter. Does **NOT** include 1 ½" Sch 40 SOLID pvc barrel or "arm" SUPPLIED BY USER.

SWP3 DETAILS

C109
Project No. 2024-317

1. Construction personnel, including subcontractors who may use or handle hazardous or toxic materials. shall be made aware of the following general guidelines regarding disposal and handling of hazardous and construction wastes:

- · Prevent spills
- · Use products up
- · Follow label directions for disposal
- · Remove lids from empty bottles and cans when disposing in trash
- · Recycle wastes whenever possible
- · Don't pour into waterways, storm drains or onto the ground
- · Don't pour down the sink, floor drain or septic tanks
- · Don't bury chemicals or containers
- · Don't bum chemicals or containers
- · Don't mix chemicals together

2. Containers shall be provided for the proper collection of all waste material including construction debris, trash, petroleum products and any hazardous materials used on-site. Containers shall be covered and not leaking. All waste material shall be disposed of at facilities approved for that material. Construction Demolition and Debris (CD□D) waste must be disposed of at an Ohio EPA approved CD□D landfill.

3. No construction related waste materials are to be buried on-site. By exception, clean fill (bricks, hardened concrete, soil) may be utilized in a way which does not encroach upon natural wetlands, streams or floodplains or result in the contamination of waters of the state.

4. Handling Construction Chemicals. Mixing. pumping. transferring or other handling of construction chemicals such as fertilizer. lime. asphalt. concrete drying compounds. and all other potentially hazardous materials shall be performed in an area away from any watercourse. ditch or storm drain.

5. Equipment Fueling and Maintenance, oil changing. etc .. shall be performed away from watercourses. ditches or storm drains. in an area designated for that purpose. The designated area shall be equipped for recycling oil and catching spills. Secondary containment shall be provided for all fuel oil storage tanks. These areas must be inspected every seven days and within 24 hrs. of a 0.5 inch or greater rain event to ensure there are no exposed materials which would contaminate storm water. Site operators must be aware that Spill Prevention Control and Countermeasures (SPCC) requirements may apply. An SPCC plan is required for sites with one single above ground tank of 660 gallons or more, accumulative above ground storage of 1330 gallons or more, or 42,000 gallons of underground storage. Contaminated soils must be disposed of in accordance with Item 8.

6. Concrete Wash Water shall not be allowed to flow to streams, ditches, storm drains, or any other water conveyance. A sump or pit with no potential for discharge shall be constructed if needed to contain concrete wash water. Field tile or other subsurface drainage structures within 10 ft. of the sump shall be cut and plugged.

7. Spill Reporting Requirements: Spills on pavement shall be absorbed with sawdust or kitty litter and disposed of with the trash at a licensed sanitary landfill. Hazardous or industrial wastes such as most solvents, gasoline, oil-based paints, and cement curing compounds require special handling. Spills shall be reported to Ohio EPA (1-800-282-9378). Spills of 25 gallons or more of petroleum products shall be reported to Ohio EPA, the local fire department, and the Local Emergency Planning Committee within 30 min. of the discovery of the release. All spills which contact waters of the state must be reported to Ohio EPA.

8. Contaminated Soils. If substances such as oil, diesel fuel, hydraulic fluid, antifreeze, etc. are spilled, leaked, or released onto the soil, the soil should be dug up and disposed of at licensed sanitary landfill or other approved petroleum contaminated soil remediation facility. (not a construction/demolition debris landfill). Note that storm water runoff associated with contaminated soils are not be authorized under Ohio EPA's General Storm Water Permit associated with Construction Activities.

9. Open Burning. No materials containing rubber, grease, asphalt, or petroleum products, such as tires, autoparts, plastics or plastic coated wire may be burned (OAC 3745-19). Open burning is not allowed in restricted areas, which are defined as: 1) within corporation limits□2) within 1000 feet outside a municipal corporation having a population of 1000 to 10,000□and 3) a one mile zone outside of a corporation of 10, 000 or more. Outside of restricted areas, no open burning is allowed within a 1000 feet of an inhabited building on another property. Open burning is permissible in a restricted area for: heating tar, welding, smudge pots and similar occupational needs, and heating for warmth or outdoor barbeques. Outside of restricted areas, open burning is permissible for landscape or land-clearing wastes (plant material, with prior written permission from Ohio EPA) , and agricultural wastes, excluding buildings.

10. Dust Control or dust suppressants shall be used to prevent nuisance conditions, in accordance with the manufacturer's specifications and in a manner, which prevent a discharge to waters of the state. Sufficient distance must be provided between applications and nearby bridges, catch basins, and other waterways. Application (excluding water) may not occur when rain is imminent as noted in the short term forecast. Used oil may not be applied for dust control.

11. Other Air Permitting Requirements: Certain activities associated with construction will require air permits including but not limited to: mobile concrete batch plants, mobile asphalt plants, concrete crushers, large generators, etc. These activities will require specific Ohio EPA Air Permits for installation and operation. Operators must seek authorization from the corresponding district of Ohio EPA. For demolition of all commercial sites, a Notification for Restoration and Demolition must be submitted to Ohio EPA to determine if asbestos corrective actions are required.

12. Process Waste Water/Leachate Management. Ohio EPA's Construction General Permit only allows the discharge of storm water and does not include other waste streams/discharges such as vehicle and/or equipment washing, on-site septic leachate concrete wash outs, which are considered process wastewaters. All process wastewaters must be collected and properly disposed at an approved disposal facility. In the event, leachate or septage is discharged□it must be isolated for collection and proper disposal and corrective actions taken to eliminate the source of waste water.

13. A Permit To Install (PTn is required prior to the construction of all centralized sanitary systems, including sewer extensions, and sewerage systems (except those serving one, two, and three family dwellings) and potable water lines. Plans must be submitted and approved by Ohio EPA. Issuance of an Ohio EPA Construction General Storm Water Permit does not authorize the installation of any sewerage system where Ohio EPA has not approved a PTI.

SPECIFICATIONS FOR SODDING

MATERIALS

1. SOD SHALL BE HARVESTED, DELIVERED AND INSTALLED WITHIN A PERIOD OF 48 HOURS. SOD NOT TRANSPLANTED WITHIN THIS PERIOD SHALL BE INSPECTED AND APPROVED PRIOR TO INSTALLATION.

2. THE SOD SHALL BE KEPT MOIST AN COVERED DURING HAULING AND PREPARATION FOR PLACEMENT.

3. SOD SHALL BE MACHINE CUT AT A UNIFORM SOIL THICKNESS OF 0.75 INCHES, PLUS OR MINUS 0.25 INCHES, AT THE TIME OF CUTTING. MEASUREMENTS FOR THICKNESS SHALL EXCLUDE TOP GROWTH AND THATCH.

SITE PREPARATION

1. A SUBSOILER, PLOW OR OTHER IMPLEMENT SHALL BE USED TO REDUCE SOIL COMPACTION AND ALLOW MAXIMUM INFILTRATION. MAXIMIZING INFILTRATION WILL HELP CONTROL BOTH RUNOFF RATE AND WATER QUALITY. SUBSOILING SHALL NOT BE CONDUCTED ON SLIP-PRONE AREAS WHERE SOIL PREPARATION SHOULD BE LIMITED ONLY TO WHAT IS NECESSARY FOR ESTABLISHING VEGETATION.

2. THE AREA SHALL BE GRADED AND TOPSOIL SPREAD WHERE NEEDED.

3. SOIL AMENDMENTS

LIME- AGRICULTURAL GROUND LIMESTONE SHALL BE APPLIED TO ACIDIC SOILS AS RECOMMENDED BY A SOIL TEST. IN LIEU OF A SOIL TEST, LIME SHALL BE APPLIED AT THE RATE OF 100 LB./1,000 SQ. FT OR 2 TONS/AC.

FERTILIZER- FERTILIZER SHALL BE APPLIED AS RECOMMENDED BY A SOIL TEST. IN LIEU OF A 2 SOIL TEST FERTILIZER SHALL BE APPLIED AT A RATE OF 12 LB./1,000 SQ. FT OR 500 LB./AC. OF 10-10-10 OR 12-12-12 ANALYSIS

THE LIME AND FERTILIZER SHALL BE WORKED INTO THE SOIL WITH A DISK HARROW, SPRING-TOOTH HARROW, OR OTHER SUITABLE FIELD IMPLEMENT TO A DEPTH OF 3 INCHES.

4. BEFORE LAYING SOD, THE SURFACE SHALL BE UNIFORMLY GRADED AND CLEARED OF ALL DEBRIS, STONES AND CLODS LARGER THAN 3-IN. DIAMETER.

SOD INSTALLATION

1. DURING PERIODS OF EXCESSIVELY HIGH TEMPERATURES, THE SOIL SHALL BE LIGHTLY IRRIGATED IMMEDIATELY BEFORE LAYING THE SOD.

2. SOD SHALL NOT BE PLACED ON FROZEN SOIL.

3. THE FIRST ROW OF SOD SHALL BE LAID IN A STRAIGHT LINE WITH SUBSEQUENT ROWS PLACED PARALLEL TO AND TIGHTLY WEDGED AGAINST EACH OTHER. LATERAL JOINTS SHALL BE STAGGERED IN A BRICK-LIKE PATTERN. ENSURE THAT SOD IS NOT STRETCHED OR OVERLAPPED AND THAT ALL JOINTS ARE BUTTED TIGHT IN ORDER TO PREVENT VOIDS THAT WOULD DRY THE ROOTS.

4. ON SLOPING AREAS WHERE EROSION MAY BE A PROBLEM, SOD SHALL BE LAID WITH THE LONG EDGE PARALLEL TO THE CONTOUR AND STAGGERED JOINTS. THE SOD SHALL BE SECURED WITH PEGS OR STAPLES.

5. AS SODDING IS COMPLETED IN ANY ONE SECTION, THE ENTIRE AREA SHALL BE ROLLED OR TAMPED TO ENSURE SOLID CONTACT OF ROOTS WITH THE SOIL SURFACE. SOD SHALL BE WATERED IMMEDIATELY AFTER ROLLING OR TAMPING UNTIL THE SOD AND SOIL SURFACE BELOW THE SOD ARE THOROUGHLY WET. THE OPERATIONS OF LAYING TAMPING AND IRRIGATING FOR ANY PIECE OF SOD SHALL BE COMPLETED WITHIN 8 HOURS.

MAINTENANCE

1. IN THE ABSENCE OF ADEQUATE RAINFALL, WATERING SHALL BE PERFORMED DAILY OR AS OFTEN AS NECESSARY DURING THE FIRST WEEK WITH SUFFICIENT QUANTITIES TO MAINTAIN MOIST SOIL TO A DEPTH OF 4-6 INCHES.

2. AFTER THE FIRST WEEK, SOD SHALL BE WATERED AS NECESSARY TO MAINTAIN ADEQUATE MOISTURE AND ENSURE ESTABLISHMENT.

3. THE FIRST MOWING SHALL NOT BE ATTEMPTED UNTIL SOD IS FIRMLY ROOTED.

WES Job No.: 2024-317 **Date: 03-28-2025**

PROJECT DESCRIPTION AND DESIGN CRITERIA

The storm water management basin for PNFM has been designed based on the City of Macedonia storm water management requirements whereas the critical storm and all more frequent storm events shall be constrained to the 1-year pre-developed runoff rate and all less frequent post-developed events shall be restricted to the correlating pre-developed runoff rates. The existing site consists of existing commercial buildings with related paved and gravel parking areas. Runoff discharges via overland flow and on-site storm sewers before ultimately reaching an unnamed tributary to Brandywine Creek.

Due to the site's pre-developed impervious coverage of 18.41 acres (10-yr average), the proposed improvements are regarded as primarily re-development. The proposed north retention basin has been designed to improve downstream conditions by meeting the previously mentioned critical storm requirements as well as water quality regulations per the Ohio Permit No. OHC000006. The basin proposed to the south is for aesthetic purposes and provides minimal water quality and quantity control.

The north basin design has been limited to 5.05 acres of impervious area within the 8.86-acre drainage area. The remainder of on-site runoff is observed as undetained.

The pre-developed drainage areas for the PNFM site:

-The pre-developed drainage area (listed as subcatchment 1S), is 24.88 Acres
(CN=90 & Tc=11.2 min.).

The post developed drainage areas for the PNFM site:

-The post-developed drainage area to the north basin (listed as subcatchment 2S), is 8.86 Acres
(CN=91 & Tc=10 min.).

-The post-developed undetained drainage area (listed as subcatchment 3S), is 16.97 Acres
(CN=90 & Tc=10 min.).

STORM ROUTING

HydroCAD Stormwater Modeling was used to perform the storm routing and the pond calculations. The increase in runoff from the pre-developed to the post developed conditions is addressed through the use of a northerly storm water retention basin.

STORM WATER QUALITY

Water Quality (WQ) will be addressed by means of a SWM Basin (north) fit with the appropriate WQ orifice. The WQ orifice will account for the drainage area and storage volume for the basin.

ROUTING THROUGH THE PROPOSED NORTH STORMWATER MANAGEMENT BASIN

The following table is a summary of the storm routing for the proposed site.

Storm Event	Pre-Developed Runoff from site, 1S c.f.s.	Allowable Outflow c.f.s.	Post-Developed Runoff to North Basin, 2S c.f.s.	Post-Developed Outflow from SWM Basin, 1P c.f.s.	Combined Outflow (Includes Undetained Runoff), 1L c.f.s.	Peak Elevation	Peak Storage, c.f.

The following table summarizes the new stormwater quality basin design information for the proposed on-site north basin:

North Stormwater Quality Basin

STORM WATER QUALITY CALCULATIONS

TECHNICAL MEMORANDUM

Ohio Environmental Protection Agency

From: Justin Reinhart, PE, Storm Water Technical Assistance

Date: October 15, 2019

Subject: Gravel, synthetic turf and non-typical landcover

This technical memo provides interim technical guidance until the *Rainwater & Land Development* manual is revised and republished.

Gravel, synthetic turf and similar constructed landcover should be considered impervious when evaluating:

1. **whether post-construction controls are required (projects that do not create any impervious surface are not required to provide post-construction BMPs),**

2. **whether the site has existing impervious area to qualify as previously developed area, and**

3. **when calculating Rv = 0.05 + 0.9(i), where "i" represents the fraction of impervious surface.**

Neither the NPDES Construction General Permit #OHC00005 (CGP) nor the current *Rainwater and Land Development* (RLD) manual provide an explicit definition of impervious surface. As described in the document *Post-Construction Storm Water Q&A - Water Quality Volume* (10/2018), Ohio EPA considers impervious cover as an "area that will be unvegetated such as rooftops, paved or gravel roads and parking lots, sidewalks, detention basins and open water." This guidance derives from the ASCE/WEF Manual of Practice (1998) discussion that "operationally, for mature urban areas, watershed imperviousness can be defined as the fraction of watershed that is unvegetated."

This singular criterion can be used to differentiate pervious and impervious surface as it relates to the effect of construction activities on water quality and receiving streams. Vegetation is an indicator of soil structure that has or is capable of developing infiltration and evapotranspiration rates correlating to a volumetric runoff coefficient (Rv) near 0.05. As described in the *Soil Management* provisional practice of the RLD manual, vigorous vegetation is both a necessary factor in maintaining infiltrating soils and is a result or product of healthy soil. Area disturbed by construction activity, regardless of the final landcover, can be rendered impervious through clearing, grading, compaction, and filling.

Gravel, synthetic turf and similar landcovers are usually placed on a graded, compacted subgrade where the topsoil has been excavated (and often geotextile material used) to form a stable foundation. Although the surface of these landcovers, unlike concrete or asphalt pavement, can be somewhat porous, the lack of infiltration at the subgrade and evapotranspiration at the surface results in a Rv more equivalent to impervious pavement. Additionally, surface grading or subsurface drainage systems are usually included for rapid drainage.

Post-Construction Controls on Gravel and Synthetic Turf

Loose gravel or synthetic turf covers do contain void space within the structure that could be utilized to provide extended detention of the Water Quality Volume (WQv) as a variation of permeable pavement.

These projects should be pre-approved by Ohio EPA and designed per the applicable specifications of the permeable pavement RLD standard as well as the following criteria:

- The area must be subject to direct rainfall only and receive no additional runoff from adjacent areas.
- The area must not be subject high traffic surface loadings or high-risk pollutants.
- The extended detention requirements must still be met. This will require an outlet structure configured to meet the 1) the 24-hour minimum WQv drain times and 2) not discharge more than the first half of the WQv in less than one-third of the drain time.
- A sand filter/ choker course is recommended.
- The aggregate layer must be clean, rinsed and free of silts and fines and consist of poorly or tightly graded aggregate (e.g. AASHTO #57, #4 or #2) or coarse sand. Well graded or gap grade aggregates such as ODOT 304 do not apply.
- The top of the water quality volume must be 2" or more from the surface.
- As referenced in the permeable pavement standard, a porosity (ϕ) of 0.30 is recommended for aggregate and 0.25 for coarse sand. This value accounts for the required additional 20% sediment storage.
- Areas with the potential to be paved over in the future should not be considered.

Where these criteria are not met, a standard Table 4a or 4b practice should be utilized.

Post-Construction Water Quality Volume
As Required Under Ohio NPDES Construction General Permit No. OHC00005

version 1.1 2020-5-7

This spreadsheet calculates the Water Quality Volume required for both new development and redevelopment projects. Green boxes indicate user input for 1) the total area disturbed, 2) planned total impervious surface and, if redevelopment, 3) total existing impervious surface, each in acres. The user must select new or redevelopment from the dropdown menu to apply the proper equation. Use the separate BMP Compliance Spreadsheets to verify a designed practice or combination of practices meets the applicable requirements including the required Water Quality Volume calculated here. This spreadsheet does not account for factors that may affect the final practice design, including offsite run-on or sediment storage volume.

SUBJECT: 8854 Valley View Road – Final Plan Approval (New Manufacturing Building)

DATE: April 12, 2025

I have reviewed an application (including a final development plan and supplemental materials) dated March 28, 2025 in connection with this request and offer the Planning Commission the following comments for their consideration:

Background

This final plan report focuses on the applicant's proposal to construct a 48-foot tall, 238,920 square foot (previously 238,070 sq.ft.) manufacturing building, on the property located at 8854 Valley View Road. The subject site contains two parcels. The first is 1.44 acres and fronts on Valley View Road. This frontage parcel is zoned R-1 Single-Family Residential and contains an existing driveway to serve the back land that is 38.79 acres and zoned General Industrial (see purple parcel in the image to the right) A portion of this 38.79 acre back property is located in Northfield Center Township and shown in the red triangle in the image to the right.

The site plan proposes the 238,920 square foot building, a location for future building expansion, rail spurs, two stormwater management basins, and fairly dense landscaping to assist with screening the building from Valley View Road and the residential neighborhoods to the east. A 75-foot access drive (previously shown as an easement) is provided to the south and coming from the existing entrance driveway. The purpose of this driveway remains unknown, but based on the aerial photograph it might be used to gain access to the trailer parking to the south of the site. The purpose of this driveway from a use standpoint needs to be discussed with the Commission. As it stands, the driveway is illustrated without a turnaround for safety forces.

Analysis – Use

The G-I District permits warehousing (via the L-I District) and specifically permits outdoor storage with certain screening/setback standards. Access to the G-I land (the backland) is provided through an existing driveway and is zoned residential. To the best of my knowledge, a driveway located through residentially zoned lands to access non-residential property is acceptable and does not appear to be addressed in the Planning and Zoning Code.

Analysis – Final Development Plan

1) The proposed plan adheres to the setback standards outlined in Section 1169.04 (f) of the Code.

2) The proposed building height of 46 feet adheres to the maximum height of 60 feet outlined in Section 1169.04 (g) of the Code.

3) The legend on site plan states that 129 off-street parking spaces (previously 132) are provided, and the building is proposed to be 238,920 square feet. Sheet PP.1 provides an analysis of parking counts and states that 130 spaces are proposed. Section 1171.11 (b) (2) provides for a 20% reduction. Therefore, parking is based on the following:
    a) 22,100 square feet of office is reduced to 17,680 square feet and calculated at one space for every 250 square feet. This yields 71 required parking spaces;
    b) 38,915 square feet of storage is reduced to 31,132 square feet and calculated at one space for every 800 square feet. This yields 39 required parking spaces;
    c) 178,036 square feet of manufacturing is reduced to 142,429 square feet and calculated at one space for every 400 square feet. This yields 357 parking spaces.
    d) The total required off-street parking based on the above break-down is 467. This means the site is deficient by 338 parking spaces if 129 spaces are provided. Sheet PP.1 proposes 387 land-banked parking spaces. However, the Planning Commission doesn't have the ability to waive the parking standard and permit land-banking. **ACTION ITEM: A variance from the Board of Zoning Appeals (BZA) is needed for the reduction and the minor discrepancy between Sheet PP.1 and C102 must be corrected.**

4) Section 1171.11 (e) (2) permits off-street parking in the front yard provided it is screened with landscaping. **ACTION ITEM: Based on discussions with the Planning Commission, the landscape mound is extended slightly to the south to properly screen the parking in front of the building. Moreover, Sheets LOS 1&2 are provided to document the line of site into the property from the main entrance. I believe the front yard parking is adequately screened.**

5) Section 1171.11 (e) (3) sets the maximum drive apron at the property line as 36 feet. **ACTION ITEM: The proposed apron at the property line exceeds the maximum permissible by Code. The applicant must seek a variance from the BZA for the increased width or reduce the apron accordingly.**

6) A 75 foot heavy duty drive is provided to the south to access the land zoned R-1 and located in Northfield Center Township. The purpose of this 75-foot access easement remains unknown, but based on the aerial photograph it might be used to gain access to the trailer parking to the south of the site. As it stands, the driveway is illustrated without a turnaround for safety forces. **ACTION ITEM: The intent of the drive must be provided. The existing trailer parking toward the southern end of the site that is in the City and zoned residential is not permissible.**

7) Sheet E0 addresses site lighting and documents compliance with the City's expectations for site lighting. **ACTION ITEM: None, the revised plan reflects compliance.**

8) Building architecture is documented on Sheet A-301 and proposes a precast wall panel style of construction. **ACTION ITEM: The building architecture is subject to the standards outlined in Section 1172 of the Code. The City's Design Consultant should review the project for compliance with the applicable Code provisions.**

9) Dumpster location is not provided - **COMMENT – The location of a dumpster and related enclosure details must be provided on the final plan. Building mechanical units should also be depicted and methods in place to screen them from view.**

10) Stormwater Management. **COMMENT – Two stormwater management basins are shown on the final plan, along with complete details to achieve a compliant Storm Water Pollution Prevention Plan (SWP3). Any Planning Commission approval must stipulate review and approval of the SWP3 by the City Engineer.**

Conclusion

The final development plan is comprehensive and provides nearly all the details for approval. However, the two issues (parking and drive width) need to be rectified by amending the plan or seeking a variance from the BZA. The other items noted in this report are fairly minor and can be corrected on a revised final plan that, if acceptable to the Commission, can be administratively approved.

Re: Plan Review Comments: Peak Nano

The plan titled PNFM, dated 03-28-25, has been reviewed. The following comments are offered:

- The plan submitted is a detailed set of plans typically submitted for permitting. This memo will provide only high-level comments on the submittal for Planning Commission purposes. The plans will be reviewed in further detail for administrative permitting separately.

- The plans show two storm water management basins, the design of which will be reviewed for conformance with chapter 920. Additionally, the standard inspection and maintenance agreement for such features would be needed from the applicant as part of final administrative permitting.

- Will the basins be wet or dry ponds?

- Please provide information regarding any future plans for the southerly portion of the site which falls within Northfield Center Township, the plans show a proposed dead end driveway to this area.

- Sanitary service is shown as being provided by a pump station and associated force main, which will outlet into a manhole near the cul-de-sac of Abraham Way. Much of this force main, and the manhole, fall within railroad owned property. The owner will need approval from Summit County DSSS, and the appropriate easement from the railroad, for this installation.

- Paving the rear driveway to the north is the correct thing to do. The most northerly end of this driveway falls within a strip of land owned by the railroad, which also becomes a common driveway with the JWD property. Please provide information regarding the ability to work across the property line and for maintenance of the shared driveway.

- The plan now shows all parking lots and driveways with perimeter concrete curb.

- For retaining walls greater than 48”, the applicant shall submit structural drawings stamped by the structural engineer of record.

- The proposed land bank parking appears to conflict with the southerly storm water management basin.

The parking, drive apron, and landscaping were discussed and that BZA variances would be needed.
